

PURADIGM TECHNOLOGY THE CONTRAST OF ACTIVE VS PASSIVE PURIFICATION

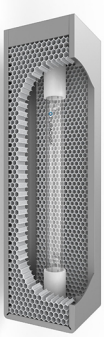

Air purification customers throughout the world have relied upon passive technologies to clean the air. These technologies include traditional filtration, electrostatic precipitators, and UV lights, requiring particles and pollutants to pass through filters or next to UV lights. Unfortunately not all of the air ever passes through these devices, and more importantly, surface contamination remains unaffected.

Why is Puradigm Technology an Effective Solution in Managing & Controlling Pathogens?

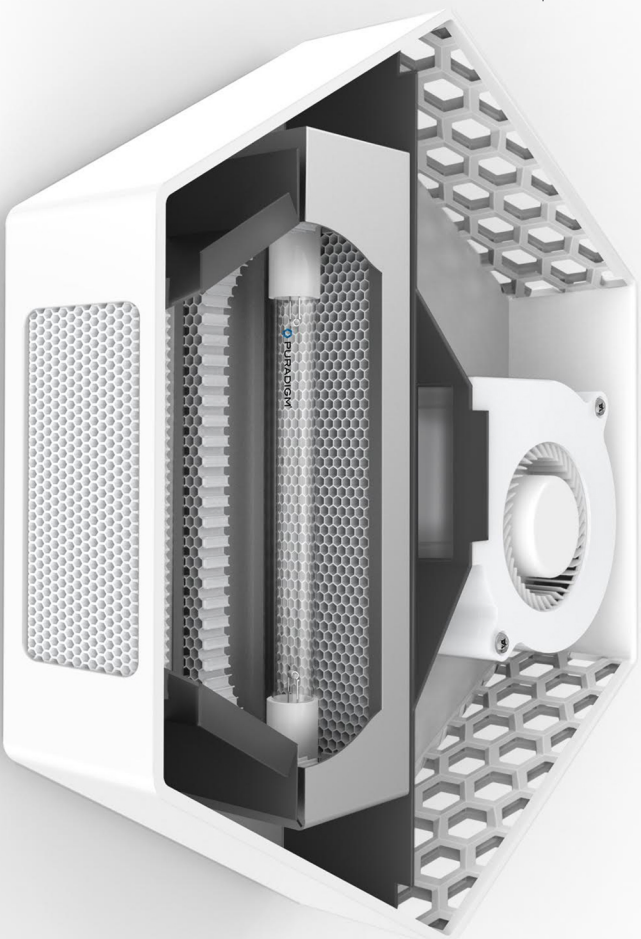

Puradigm has been working with leading scientists across the world for over 10 years to develop the most advanced solution for tackling the harshest indoor environmental issues. The Puradigm Technology produces High Energy Clusters (HEC) and advanced oxidation that result in the management of bacteria, virus and other pathogens from the environment.

High-Energy Clusters used to break down cell membrane structures of pathogens do not affect human & animal cells as human cells are devoid of the fragile trans-membrane surface structures found on pathogens.

Puradigm Kill Mechanism is Nature's Most Natural Energy Solution

Typical living or working space with multiple contaminants and contaminant sources. Airborne & surface mold, bacteria and virus's.

Filter type units (Passive Purification) clean the air around the unit by pulling the air through the unit. Issue is that air throughout the space remains untreated and ALL of the SURFACES are untreated.

The PURADIGM Active Air Purification System emits "High Energy Clusters" into the space cleaning the air as well as the surfaces in the entire space.
